### Descriptions of Indexes

- One-year bonds: DFA One-Year Fixed Income fund
- Five-year bonds: DFA Five-Year Global Fixed
- Intermediate bonds: DFA Intermed. Gov’t Bond fund
- U.S. Large Market: DFA U.S. Large Co. fund
- U.S. Large Value: DFA Large Cap Value fund
- U.S. Small Market: DFA U.S. Small Cap fund
- U.S. Small Micro: DFA U.S. Micro Cap fund
- U.S. Small Value: DFA U.S. Small Value fund
- Real Estate: DFA Real Estate Securities fund
- Int’l Large Market: DFA Large Cap Int’l fund
- Int’l Large Value: DFA Int’l Value fund
- Int’l Small Market: DFA Int’l Small Company fund
- Int’l Small Value: DFA Int’l Small Value fund
- Emerging Markets: DFA Emerging Markets fund

*Last 10 yrs.* returns are ended 12/31/10.

Equius Partners is an investment advisor registered with the Securities and Exchange Commission. Consider the investment objectives, risks, and charges and expenses of any mutual fund and read the prospectus carefully before investing. Indexes are not available for direct investment; therefore, their performance does not reflect the expenses associated with the management of an actual portfolio. Past performance is not a guarantee of future results.

### North Koreans, Cubans & Active Managers

**Jeff Troutner, Equius Partners**

Regular readers of *Asset Class* know the general disdain we at Equius Partners have for “Wall Street.” Given the tone and message(s) of the protests in New York and elsewhere, however, it’s probably a good time to clarify what we mean by that term.

When we refer to “Wall Street,” we mean all the people, resources, marketing, and profits associated with the beat-the-market segment of the securities industry—whether retail or institutional—that is targeted at long-term investors. That qualifier, “long-term investors,” is an important one. We actually have much affection for the beat-the-market crowd within the speculative context they belong. The relatively few unknowable (in advance) winners—be they sophisticated hedge fund managers or delusional day traders—and millions of ordinary and extraordinary losers in the stock-picking and market-timing game play a critical role in creating a large, very liquid, and highly efficient stock market for the rest of us.

What we also appreciate about Wall Street is the investment banking side that facilitates the funding, in the form of either debt or equity, for new or growing businesses. To use a timely example, we wouldn’t have Apple without Wall Street. Instead, we’d have a bunch of Solyndras (the solar panel company we taxpayers involuntarily funded to the tune of $548 million just before it declared bankruptcy). And without a secondary market like the New York Stock Exchange, the primary market (initial public offerings) couldn’t survive.

This leads me to another gem from my financial media archives. Last month I resurrected a classic *Forbes* article by Warren Buffett to speak to the unique opportunity extreme economic and market uncertainty creates for investors. This wasn’t an endorsement of active managers like Buffett, of course, since falling prices create higher expected returns for passive asset class investors with much greater certainty of capturing them. So the issue was *timing*, not investment philosophy. This month I want to turn your attention to an even more important perspective than Buffett’s, with far greater implications for most investors.

The following is a transcript of Rex Sinquefield’s opening statement in debate with Donald Yacktman at the Schwab Institutional conference in San Francisco, October 12, 1995. Rex is the co-founder, with David Booth, of Dimensional Fund Advisors. After graduating from the University of Chicago, where he studied efficient market theory under Eugene Fama, Sr., Rex initiated the launch of the first S&P 500 index fund at the American National Bank (three years ahead of Vanguard’s first index fund). He retired in 2005.

Active vs. Passive Management

By Rex A. Sinquefield, October 1995

Let us agree on what we are debating, discussing and disagreeing about: active vs. passive management. Active management is the art of stock picking and market timing. Passive management refers to a buy-and-hold approach to money management. It can be applied to any asset class: big stocks, small stocks, value or growth, foreign or domestic can all be accessed by passive techniques. Neither label, “active” or “passive,” is perfect, and there will not always be a complete dichotomy between them. In any event, this is a debate about both market behavior and investor behavior. Efficient market theory is the theory postulating that market prices reflect the knowledge and expectations of all investors. It asserts that any new development is instantaneously priced into a security, thus making it impossible to consistently beat the market.

With respect to market behavior there are, at the extremes, two views. At one extreme is the well-known efficient market theory, which says that the prices are always fair and quickly reflective of information. In such a world neither professional investors nor the proverbial “little investors” will be able to systematically pick winners... or losers. At the other extreme is what I’ll call the market failure hypothesis. According to this view, prices react to information slowly enough to allow some investors, presumably professionals, to systematically outperform markets and most other investors.

At the level of investor behavior, this discussion deals with how a financial advisor should handle his or her clients’ money. It is my contention that active management does not make sense theoretically and isn’t justified empirically. Other than that, it’s OK. But it’s easy to understand the allure, the seductive power of active management. After all, it’s exciting, fun to dip and dart, pick stocks and time markets; to get paid high fees for this, and to do it all with someone else’s money.

Passive management, on the other hand, stands on solid theoretical grounds, has enormous empirical support, and works very well for investors.

At the end of 1973 there was $50 million invested in index funds. Today, there is roughly $1 trillion invested in passive portfolios of all sorts in the United States and abroad. Clearly, this is an idea that is here to stay. A rather impressive group of investors worldwide believes it is difficult to beat markets and perhaps better not to try. These investors are responding to a mountain of evidence that markets work. Such investors believe that in every asset class they choose, their best course of action is to accept market returns. Where is this mountain of evidence? The 20th century has produced two grand experiments that bear directly on the question “do markets work?” One experiment took place on the geopolitical stage and the other in the halls of academia.

The intellectual origin for the role of free markets and the price system goes back to Adam Smith. He was the first to offer a comprehensive statement that markets work and that a free market is the best way for a social order to allocate resources. In his Wealth of Nations he shows that countries with such a system prosper, while those without do not.

Friedrich Hayek extended the work of Smith and tried to provide insight as to why and how the free market system works. The key idea is that the price system is a mechanism for communicating information. The knowledge that is relevant for producing any good or service is never possessed by a single individual or a single group. Rather, it is dispersed among many market participants. The price system acts to spread this knowledge and coordinate the actions of individuals. Perhaps an example from Hayek will help.

Suppose somewhere in the world a new use for some material, say silver, has arisen, or that an important source of supply is eliminated. It is significant that it does not matter what is the cause of this new scarcity. All that the users of silver need to know is that silver is now more profitably employed elsewhere and they should economize. It is not even necessary that the majority of silver users know the new need. If only some know, they can direct silver to its highest use and fill in from other sources of supply. This, in turn, will influence the other users and suppliers of silver, and the substitutes of silver, and so on. And all the while, the vast majority may be unaware of the original causes of these changes. The whole acts as one market, not because anyone surveys the whole field or knows all the facts, but because the participants’ limited fields of vision sufficiently overlap and, through intermediaries, communicate the relevant information to all. Because there is only one price—allowing for transport costs—means that had there been an all-knowing person possessing all the dispersed knowledge of the market, his pricing solution could only be the same as the one chosen by the market. As Hayek pointed out in his Nobel laureate lecture, we are only beginning to understand how subtle and efficient is the communication mechanism we call the market. It garners, comprehends and disseminates widely dispersed information better and faster than any system man has deliberately designed.

But there is another side to this story. The ideas advanced by Adam Smith were not only ideas. An abiding faith in the power of man’s reason was...
augmented by the success in the physical sciences. From the middle of the 19th century to the 20th century there was a growing belief among some intellectuals that man's success in the physical world could be applied to the social order as well.

This was in part the intellectual genesis of the first grand experiment referred to earlier. In 1917, much of the world began organizing itself—forcibly and brutally —on a belief that centrally administered prices and planning is superior to a system based on free market prices. Surely, a group of bright people by intelligent design and management could increase social welfare better than a system that was undesigned and unmanaged. So, much of the world was subjected to socialism. But deprived of a mechanism to gather and disseminate the widely dispersed information on how to deploy society's resources for the production of goods and services, deprived of free market prices, it was inevitable that socialist countries would collapse. In retrospect, it would be impossible to design a more controlled experiment at the geopolitical level than the one we witnessed for most of this century. The verdict is in. The socialists have thrown in the towel. And in some of these countries, the new emergent hero is none other than Adam Smith.

So who still believes markets don't work? Apparently it is only the North Koreans, the Cubans and the active managers.

Now let us consider the second big experiment, that which began in academia in the 1950s. The early work of Markowitz, Miller, Sharpe and Fama was transforming the field of finance from an ad hoc collection of courses to a serious and legitimate field of academic and scientific inquiry. Their work shaped and defined the field of finance and how the investigation of market activity would proceed over the next 30 years. They spelled out the idea of market efficiency and provided evidence on its behalf.

The notion of efficient markets was simply a specific application to the financial markets of the more general idea that free and competitive markets work. Most people in the western world and especially in the US are ardent defenders of free enterprise, which depends on the idea that markets work. The literature on efficient markets over the last 30 years is a test of that proposition applied to the capital markets. The resounding success of these tests should bring joy to any fan of free markets.

Debate about active management vs. passive management began in earnest in the early 1970s. Already by then, researchers had uncovered considerable evidence that past prices were of little benefit in forecasting future prices in ways that would earn excess profits; that fundamental data was too quickly reflected in prices to allow such data to be used for beat-the-market purposes; and, most importantly for us, that professional money managers could simply not outperform markets in any meaningful sense. The latter tests are most pertinent for us, and of these, there is not one major published study that successfully claims that managers beat markets by more than one would expect by chance.

Several recent studies deserve brief mention. In the first major study of bond market performance, Blake, Elton and Gruber examine as many as 361 bond funds for the period starting in 1977. They compare the various active funds to simple index strategy alternatives. The authors find that the active funds, on average, underperform the index strategies by 85 basis points a year. Depending on the benchmark, between 65 and 80 percent of the funds generate excess performance that is negative.

In a study of equity mutual funds, Elton, Gruber, Hlavka and Das examine all funds that existed for the period of 1965-1984, 143 funds in all. These funds are compared to the set of index funds—big stocks, small stocks and fixed income—that most closely correspond to the actual investment choices made by the mutual funds. The result: on average these funds underperform the index funds by a whopping 159 basis points a year. Not a single fund generated positive performance that was statistically significant. In the most recent and comprehensive study done to date, a dissertation at the University of Chicago, Mark Carhart studies a total of 1,892 funds that existed anytime between 1961 and 1993. After adjusting for the common factors in returns, an equal-weighted portfolio of the funds underperformed by 1.8 percent per year.

These studies, along with earlier studies, provide a 50-year history of professional investment management. The message is clear: the beat-the-market efforts of professionals are impressively and overwhelmingly negative. In any asset class, the only consistently superior performer is the market itself.

It is well to consider, briefly, the connection between the socialists and the active managers. I believe they are cut from the same cloth. What links them is a disbelief or skepticism about the efficacy of market prices in gathering and conveying information.

Fortunately, there is something that makes these two groups dissimilar as well. The socialists, all too often, would impose their view on society, thus producing all the well-known painful consequences. The cost they impose is a public cost borne by nearly all members of a society. Active managers, on the other hand, are far more benign. They do their picking and timing, and
because they do it too often, they impose costs on their clients. But the cost they impose is a private cost borne voluntarily by their clients. But the bottom line is, given all the evidence from history, geopolitics and academia, it just doesn’t make sense to believe markets don’t work. It is no longer a credible position.

Finally, aside from these considerations of theory and evidence, there is a very practical advantage to passive management. Passive management when applied to a client’s entire portfolio is really asset class investing. This means investing literally in asset classes via passive portfolios that capture, in their entirety, the asset class or classes under consideration. For most asset classes there are longtime series of historical data that allow us to form reliable estimates of the risk of a given class and how closely the behavior of that class correlates with the behavior of other classes. An advisor can estimate the risk of different combinations of asset categories and find the overall portfolio strategy that best suits the circumstances and risk tolerance of his or her client. Thus, a financial advisor can use historical data to form a long-run plan. That plan can be implemented exactly by investing in those same asset classes via passive or asset class portfolios.

But a financial advisor forfeits all of these advantages if he or she abandons passive investing. Actively managed portfolios seldom bear a reliable relation to any asset class. It is generally difficult to estimate future risk levels of actively managed portfolios, or to know how an active portfolio will relate to various asset classes in the future because such portfolios may experience radical shifts in their strategy. Thus, it is nearly impossible to engage in or implement long-range planning if the inputs are actively managed portfolios.

In short, asset class investing is consistent with what we know about how free and fair markets function. Active management is not. Asset class investing is supported by the results of scores of empirical studies of 50 years of professionally managed portfolios. Active management is not. Finally, asset class investing allows reliable planning and implementation of portfolio strategies. It is demonstrably successful and the most prudent way to invest a client’s money.

By now, ladies and gentlemen, all of you probably agree with me. Those of you who have been seduced by the dark side of the force are surely eager to return home. But there is still one person who disagrees with us. And now it is time to hear from him.

Thank you very much.
